

Patent Number: 84545 (R.O.C.)

Patent Pending: 08/214, 079 (U.S.A.)

### Features

- Operating voltage: 1.2V~1.7V
- Low operating current: 3 $\mu$ A (typ.)
- Dialing number and conversation time display
- Conversation timer (59 mins and 59 secs max.)
- 8 or 10-digit LCD display driver; 3V, 1/2 bias, 1/3 duty (8-digit hand-held calculator LCD used for 8-digit applications)
- Real time clock with stopwatch
- Built-in dialer interface
- 12-hour or 24-hour format
- Two-button sequential operation for real time clock setting
- Uses 32768Hz crystal

### Applications

- Timers, clocks, watches
- LCD display drivers
- Telephone display interface
- Instrument display

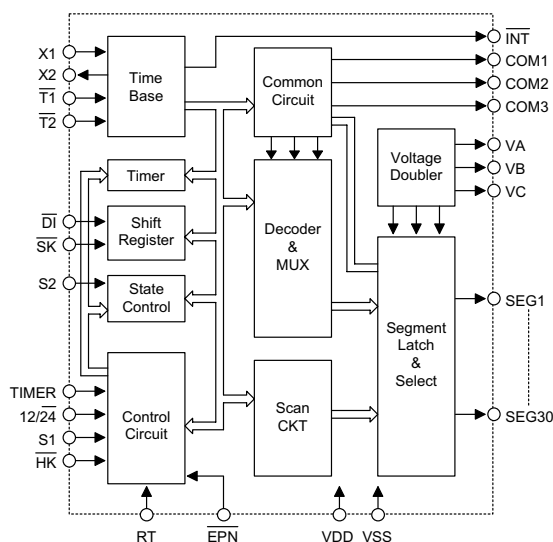

### General Description

The HT1611C is a CMOS chip designed for dialer interfaces driving 8 or 10-digit LCDs. Various functions, such as real time clock, dialing number and conversation time display are provided.

The real time is displayed by default. When answering a telephone call, the timer is activated to tell users how long the conversation has taken. After the telephone is hung up, the total conversation time is shown for about 5

seconds and then the real time is displayed again. When making a phone call, the HT1611C receives the dialing data from the dialer and displays the phone number from left to right on the LCD. However, if there is no dialing action within 10 seconds, it restarts the timer again. By adding a TIMER key, the HT1611C can provide a stopwatch function and timer reset/hold functions (for details, refer to the functional description).

## Absolute Maximum Ratings

Supply Voltage .....	-0.3V to 5V	Storage Temperature .....	-50°C to 125°C
Input Voltage .....	$V_{SS}-0.3$ to $V_{DD}+0.3$	Operating Temperature .....	-20°C to 75°C

Note: These are stress ratings only. Stresses exceeding the range specified under "Absolute Maximum Ratings" may cause substantial damage to the device. Functional operation of this device at other conditions beyond those listed in the specification is not implied and prolonged exposure to extreme conditions may affect device reliability.

## Functional Description

### Operational flow chart

# On-hook & off-hook

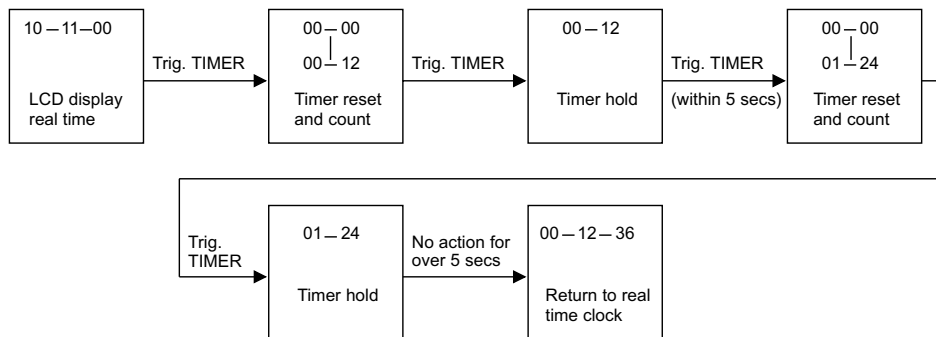

Note: Block A shows the switches S1 and S2 that are used for setting and selecting.

Block B illustrates a timer mode when Off-hook; timer resets and starts to count the conversation time.

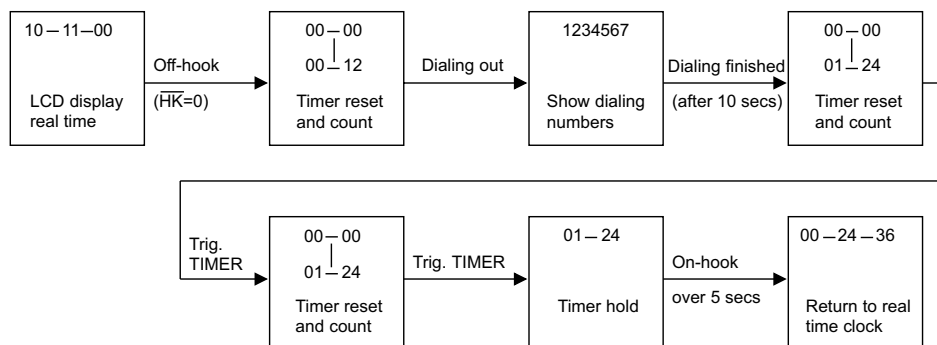

In Block C, the dialing data is received and displayed on the LCD from left to right after Off-hook. When the entry interval is over 10 seconds, it resets the timer and starts to count.

## TIMER key function

The TIMER key is used to start/stop the timer (toggle). In real time mode, it can perform a stopwatch function.

In the conversation timer mode, it can reset or hold the timer.

# Data & Timing

- For telephone application

The HT1611C is designed to display telephone numbers derived from the HT93XXX series telephone dialers. The corresponding data is illustrated in the following table.

Key-In	Data Code				Display
	b3	b2	b1	b0	
Blank	0	0	0	0	Blank
1	0	0	0	1	1
2	0	0	1	0	2
3	0	0	1	1	3
4	0	1	0	0	4
5	0	1	0	1	5
6	0	1	1	0	6
7	0	1	1	1	7
8	1	0	0	0	8
9	1	0	0	1	9
0	1	0	1	0	0
*	1	1	0	1	*
#	1	1	0	0	#
F	1	0	1	1	F
P	1	1	1	0	P
	1	1	1	1	-

- For instrument or  $\mu$ C application

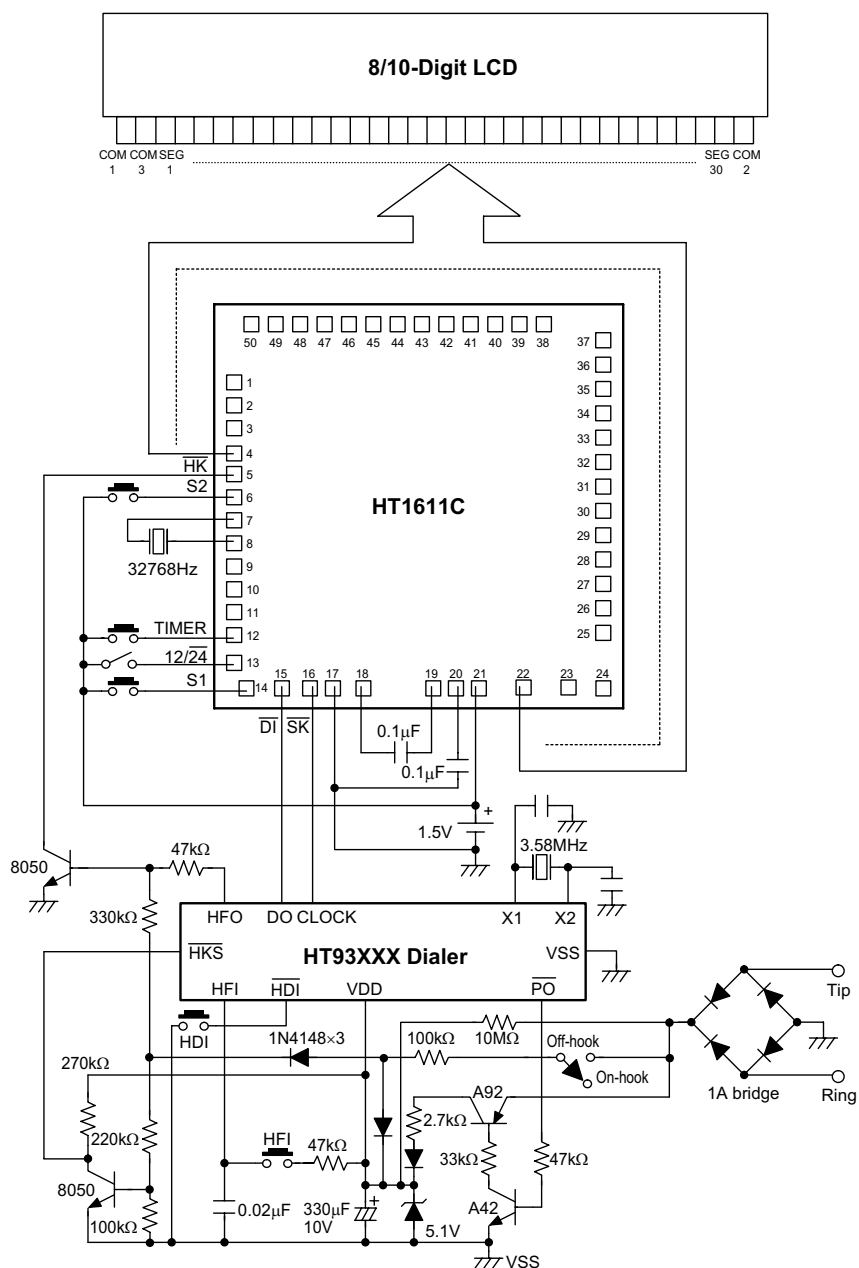

The HT1611C is also capable of displaying BCD data generated from instrument or a  $\mu$ C system. The corresponding data and timing is shown in the Data latch timing. Before the data is transmitted to the HT1611C, the  $\overline{HK}$  pin should be pulled-low or continuously kept low. The HT1611C is then ready to receive the data. At the falling edge of the clock the data is shifted in to the IC. After all the data is sent to the HT1611C, the  $\overline{SK}$  pin is set low to avoid switching to the timer mode.

## Application Circuits

For telephone interfacing (with batteries)

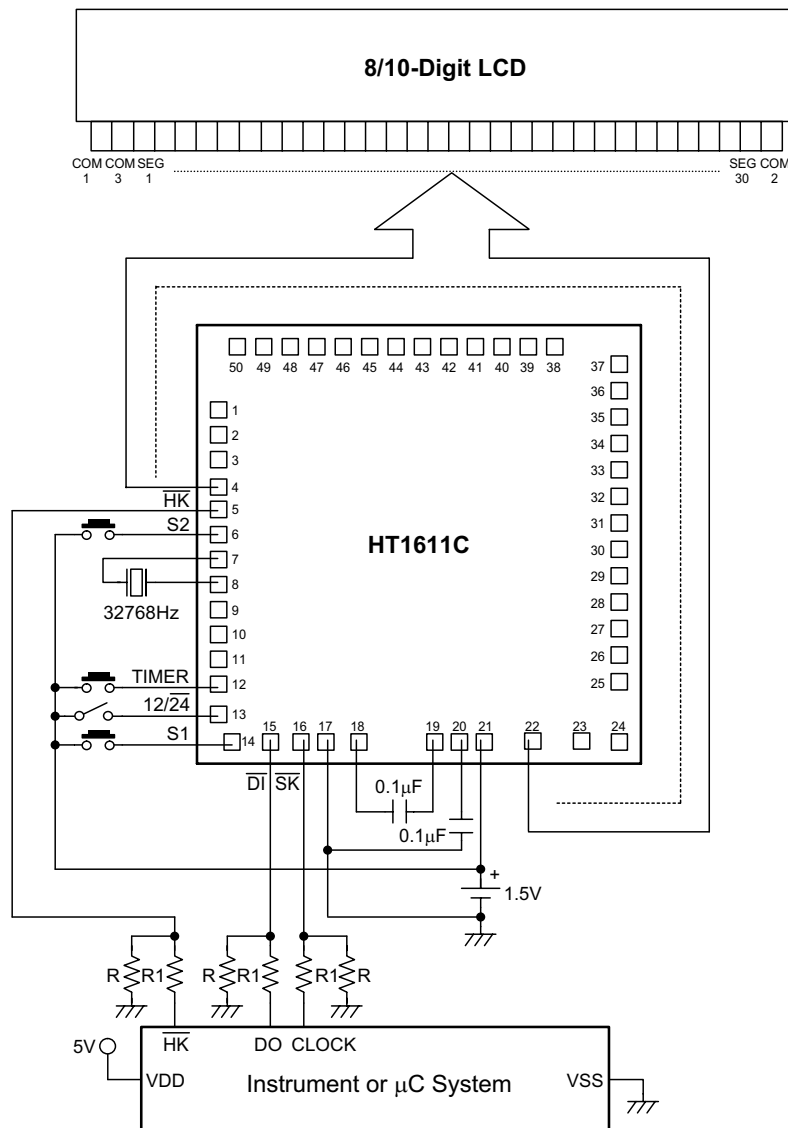

\* The IC substrate should be connected to VDD in the PCB layout artwork.

The diagram illustrates a circuit for a 32768Hz timer and an HT93XXX dialer. At the top, a 40-pin connector is labeled "8/10-Digit LCD" with pins grouped as COM COMSEG (1 3 1) and SEG COM (30 2). Below this is the HT1611C LCD driver, which has 38 pins. It is connected to the LCD connector and a 32768Hz crystal oscillator. The HT1611C also has a "TIMER" input. The HT93XXX Dialer has pins for HFO, DO CLOCK, X1, X2, VSS, PO, HFI, HDI, and VDD. It is connected to a 3.58MHz crystal oscillator and a 1N4148 diode. The circuit includes various resistors (47kΩ, 330kΩ, 270kΩ, 220kΩ, 100kΩ, 20kΩ, 2.7kΩ, 33kΩ, 47kΩ) and capacitors (0.1μF, 0.02μF, 330μF, 10V, 1μF). A 5.1V regulator is used for the HT93XXX. The output of the HT93XXX is connected to a 1A bridge rectifier, which has "Tip" and "Ring" terminals. The circuit is powered by a 5.1V regulator and a 3.58MHz crystal oscillator.

For instrument or  $\mu$ C use

\* The IC substrate should be connected to VDD in the PCB layout artwork.

Note: To drive  $\overline{SK}$ ,  $\overline{DI}$ ,  $\overline{HK}$ , an open drain NMOS output structure is recommended.

To drive  $\overline{SK}$ ,  $\overline{DI}$  and  $\overline{HK}$  with a CMOS output structure, a voltage divider is needed ( $R=4.3k\Omega$ ,  $R1=10k\Omega$ ).

## LCD Configuration

For 8-digit application

- Segment electrode side

LCD driving system 1/2 bias, 1/3 duty, 3V

- Common electrode side

- LCD connection

**For 10-digit application**

- Segment electrode side

LCD driving system 1/2 bias, 1/3 duty, 3V

- Common electrode side

- LCD connection
